**Introduction**

Renin is an enzyme that participates in the renin-angiotensin system (RAS) that mediates extracellular volume, and arterial vasoconstriction. It regulates blood pressure and electrolyte homoeostasis. At the first and rate-limiting step of the RAS cascade, renin cleaves angiotensinogen to yield angiotensin I, which is further converted into angiotensin II by Angiotensin Converting Enzyme (ACE). Angiotensin II constricts blood vessels leading to increased blood pressure. It also increases the secretion of ADH and aldosterone, and stimulates the hypothalamus to activate the thirst reflex. An over-active renin-angiotensin system leads to vasoconstriction and retention of sodium and water. These effects lead to hypertension. Thus, renin is an attractive target for the treatment of this disease.

The Amplite™ Renin Assay Kit provides a convenient assay for high throughput screening of renin inhibitors and for continuous assay of renin activity using our proprietary Fluor™ 3(TF3) / Tide Quencher™ 3 (TQ3) fluorescence resonance energy transfer (FRET) peptide. In the FRET peptide the fluorescence of TF3 is quenched by TQ3. Upon cleavage into two separate fragments by renin, the fluorescence of TF3 is recovered, the fluorescent signal can be easily monitored by a fluorescence microplate reader at Ex/Em = 540/590 nm. This assay is about fifty fold more sensitive than an EDANS/DABCYL-based assay. With the Amplite™ Renin Assay Kit, we have detected as little as 1ng renin in a 100 µL reaction volume.

**Kit Components**

**Assay Protocol for One 96-Well Plate**

**Brief Summary**

Add appropriate controls, or test samples (50 µL) → Add Renin Red™ substrate solution (50 µL) → Incubate for 30-60 min at 37°C incubator (for end point reading) → Monitor fluorescence intensity at Ex/Em = 540/590 nm

**Note:** Thaw all the kit components at room temperature before starting the experiment.

1. Prepare Renin containing biological samples as desired.
2. Prepare Renin Assay Mixture by dilute reconstituted 100X Renin Red™ Substrate stock solution (Component A) with Assay Buffer (Component C) at 1:100 as shown in Table 1.

**Table 1: Renin Assay Mixture for one 96-well plate (100 assays)**

</tr>
<tr>
<td>Total volume</td>
<td>5.05 mL</td>
</tr>
</tbody>
</table>

*Note: The Renin Red™ Substrate should be used promptly. Any remaining solution should be aliquoted and frozen at -20 °C.

3. Prepare serially diluted Renin standards (0 to 1 pg/mL):
   - 3.1. Add 12.5 µL of 40 µg /mL Renin Standard (Component B) into 487.5 µL of Assay Buffer (Component B) to get 1µg /mL Renin standard solution.
   - 3.2. Take 150 µL of 1 µg/mL Renin standard solution (from Step 4.1) to perform 1:3 serial dilutions to get 300, 100, 30, 10, 3, 1 and 0 ng /mL serially diluted Renin standards.
   - 3.3. Add Renin standards and/or Renin -containing test samples into a black wall/solid bottom 96-well microplate as described in Tables 2 and 3.

</tbody>
</table>

Note 1: Add the serially diluted Renin standards from 1 ng/mL to 1000 ng/mL into each well from Ren 1 to Ren 7 in duplicate. For 384-well plates, use 25 μL/well.

Note 2: The Renin standards are for positive control only, and should not be relied on as a quantitation standard for enzyme activity.

4. Run the enzyme reaction:

4.1. Pre-incubate the plate at a desired temperature for the enzyme reaction (e.g. 25 °C or 37 °C) for 10-15 min if you are screening Renin inhibitors.

4.2. Add 50 μL (96-well) or 25 μL (384-well) of Renin Red™ substrate solution (from Step 3) to the sample and control wells of the assay plate.

4.3. Incubate the reaction at 37 °C incubator for 30 to 60 minutes.

4.4. Monitor the fluorescence intensity with a fluorescence plate reader at Ex/Em = 540/590 nm (cut off = 570 nm).

   **For kinetic reading:** Immediately start measuring fluorescence intensity and continuously record data every 5 minutes for 30 to 60 minutes.

   **For end-point reading:** Incubate the reaction at 37°C for 60 minutes or longer, kept from light if possible. And then measure the fluorescence intensity.

Note: The selectivity of the renin substrate used in the kit has not been thoroughly tested. It may also response to other proteases since peptide-based protease substrates generally have low selectivity. One might use a renin-specific inhibitor for its specific test, such as in the presence of a renin-specific inhibitor, hydrolysis of the substrate is only due to the non-specific protease activity. The difference between the total activity and the activity in the presence of renin specific Inhibitor, gives the renin activity in the sample.

Data analysis

The fluorescence in the substrate control well is used as a control, and is subtracted from the values for other wells with the enzyme reactions.

![Figure 1](image.png)

**Figure 1.** Renin dose response was measured with Amplite™ Fluorimetric Renin Assay Kit in a 96-well black solid plate using a Gemini fluorescence microplate reader (Molecular Devices). As low as 10 ng /mL Renin was detected with 60 minutes incubation in 37°C.
