### Introduction

Actin is a globular, roughly 42-kDa protein found in almost all eukaryotic cells. It is also one of the most highly-conserved proteins, differing by no more than 20% in species as diverse as algae and humans. Actin is the monomeric subunit of two types of filaments in cells: microfilaments, one of the three major components of the cytoskeleton, and thin filaments, part of the contractile apparatus in muscle cells. Actin participates in many important cellular processes including muscle contraction, cell motility, cell division and cytokinesis, vesicle and organelle movement, cell signaling, as well as the establishment of cell junctions and cell shape.

Our Cell Navigator™ fluorescence imaging kits are a set of fluorescence tools for labeling sub-cellular organelles such as membranes, lysosomes, mitochondria and nuclei, etc. The selective labeling of live cell compartments provides a powerful method for studying cellular events in a spatial and temporal context.

This particular kit is designed to label F-actins of fixed cells in orange fluorescence. The kit uses an orange fluorescent phalloidin conjugate that is selectively bound to F-actins. The orange fluorescent phalloidin conjugate has Ex/Em = 550/575 nm. The conjugate also has good photostability for fluorescence imaging. It is a high-affinity probe for labeling, identifying and quantitating F-actin in formaldehyde-fixed and permeabilized tissue sections, cell cultures or cell-free experiments. The kit provides all the essential components with an optimized labeling protocol.

### Kit Components

### Assay Protocol

**Brief Summary**

Prepare samples (microplate wells) → Remove the liquid from the plate → Add 100 μL/well of iFluor™ 546-Phalloidin solution → Stain the cells at RT for 15 to 60 minutes → Wash the cells → Examine the specimen under microscope using TRITC channel (Ex/Em = 550/575 nm)

**Note:** Warm all the components to room temperature before opening.

1. **Prepare 1X iFluor™ 546-Phalloidin working solution:**
   
   Add 10 μL of iFluor™ 546-Phalloidin (Component A) to 10 mL of Labeling Buffer (Component B).

   **Note 1:** The unused iFluor™ 546-Phalloidin stock solution (Component A) should be aliquoted and stored at -20° C. Protect from light.

   **Note 2:** Different cell types might be stained differently. The concentration of iFluor™ 546-Phalloidin working solution should be prepared accordingly.

2. **Stain the cells:**
   
   2.1 Perform formaldehyde fixation. Incubate the cells with 3.0–4.0 % formaldehyde in PBS at room temperature for 10–30 minutes.

   **Note:** Avoid any methanol containing fixatives since methanol can disrupt actin during the fixation process. The preferred fixative is methanol-free formaldehyde.

   2.2 Rinse the fixed cells 2–3 times in PBS.
2.3 **Optional**: Add 0.1% Triton X-100 in PBS into fixed cells (from Step 2.2) for 3 to 5 minutes to increase permeability. Rinse the cells 2–3 times in PBS.

2.4 Add 100 μL/well (96-well plate) of iFluor™ 546-Phalloidin working solution (from Step 1) into the fixed cells (from Step 2.2 or 2.3), and stain the cells at room temperature for 15 to 60 minutes.

2.5 Rinse cells gently with PBS 2 to 3 times to remove excess dye before plate sealing and imaging by using TRITC channel.

**Figure 1.** Fluorescence image of HeLa cells fixed with 4% formaldehyde then stained with Cell Navigator™ F-Actin Labeling Kit *Orange Fluorescence* in a Costar black 96-well plate. Cells were labeled with iFluor™ 546-Phalloidin (Cat#22663, Red) and nuclei stain DAPI (Cat#17507, Blue), respectively.
